## **DETAILED ACTION**

### ***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 17b October 2008 has been entered.

### ***Allowable Subject Matter***

2. Claims 1-7, 9-10, 21-27 and 29-30 are allowed.
3. The following is an examiner's statement of reasons for allowance:

**Regarding claims 1 and 21,** Applicant discloses generating an initial sequence number in a manner to prevent the local server from being attacked on the basis of the sequence number by generating a random input key using a secret maintained by the local server, receiving connection identification for the remote client, initializing an hash function with the secret and connection information and calculating a value using the hash function, creating a monotonically increasing counter using timer information and connection rate information, incrementing the counter a fixed amount over a period of time, determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on the connection rate, combining the fixed value of the counter and the variable value from the

connection rate with the value from the hash value to create he initial sequence number.

**"Defending Against Sequence Number Attacks"** by *Bellovin* discloses a method of generating initial sequence numbers to prevent attacks, including generating a random input key using a secret maintained by the local server, receiving connection identification for the remote client, initializing an hash function with the secret and connection information and calculating a value using the hash function, creating a monotonically increasing counter, incrementing the counter a fixed amount over a period of time, creating a variable value and combining the fixed value of the counter and the variable value with the value from the hash value to create he initial sequence number. *Bellovin* does not disclose determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on the connection rate, combining the fixed value of the counter and the variable value from the connection rate with the value from the hash value to create he initial sequence number.

**CERT Advisory CA-2001-09 Statistical Weakness in TCP/IP Initial Sequence Numbers** by *CERT* discloses a method of generating initial sequence numbers to prevent attacks, including generating a random input key using a secret maintained by the local server, receiving connection identification for the remote

client, initializing an hash function with the secret and connection information and calculating a value using the hash function, creating a monotonically increasing counter, incrementing the counter a fixed amount over a period of time, creating a variable value and combining the fixed value of the counter and the variable value with the value from the hash value to create he initial sequence number. *CERT* does not disclose determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on the connection rate, combining the fixed value of the counter and the variable value from the connection rate with the value from the hash value to create he initial sequence number.

**U.S. Patent Application Publication No. 2001/0042200 by *Lamberton et al.*** discloses the generation of initial sequence numbers to prevent flooding attacks including generating a random input key using a secret maintained by the local server, receiving connection identification for the remote client, initializing an hash function with the secret and connection information and calculating a value using the hash function, creating a monotonically increasing counter, incrementing the counter a fixed amount over a period of time, creating a variable value and combining the fixed value of the counter and the variable value with the value from the hash value to create he initial sequence number. *Lamberton* does not disclose determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on

the connection rate, combining the fixed value of the counter and the variable value from the connection rate with the value from the hash value to create he initial sequence number.

**U.S. Patent Application Publication No. 2004/0230323 by Glanzer et al.** discloses determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on the connection rate. *Glanzer*, however, is not prior art, as the filing date of the instant application precedes the effective filing date of *Glanzer*, and the provisional application upon which *Glanzer* relies does not contain support under 35 U.S.C. 112 1st paragraph for the recited subject matter.

**The present invention distinguishes over the art of record in that none of the art of record discloses determining a connection rate for the local server by counting the number of connections per unit time, determining a variable amount based on the connection rate, combining the fixed value of the counter and the variable value from the connection rate with the value from the hash value to create he initial sequence number.**

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
